GENERAL NOTES

A Corrosion Inhibitor, as covered in the Special Provisions, shall be used in the concrete or precast prestressed concrete deck beams.

Reinforcement bars shall conform to the requirements of ASTM A 706 Gr 60 (IL Modified). See Special Provisions

Reinforcement bars designated (E) shall be epoxy coated.

Plan dimensions and details relative to existing plans are subject to routine variations. The Contractor shall field verify existing dimensions and details affecting new construction and make necessary approved adjustments prior to construction or ordering of materials. Such variations shall not be cause for additional compensation for a change in scope of the work, however, the Contractor will be paid for the quantity actually furnished based upon the unit price bid for the work.

The contractor is advised that the existing PPC deck beams are in a deteriorated condition with reduced load carrying capacity. It is the contractor's responsibility to account for the condition of the beams when developing construction procedures for removal and replacement of the superstructure.

The minimum thickness of the concrete overlay shall be 5" and varies as required to adjust for the profile grade and camber.

If the contractor's procedures for existing beam removal or placement of new beams involves placement of heavy equipment on the new or existing deck beams, a detailed procedure shall be submitted to the Engineer for approval. The procedure shall include calculations, sealed by an Illinois Licensed Structural Engineer, verifying the structural adequacy of the beams for the proposed loads. Cost included with Removal of Existing Superstructures.

No in-stream work will be allowed on this project.

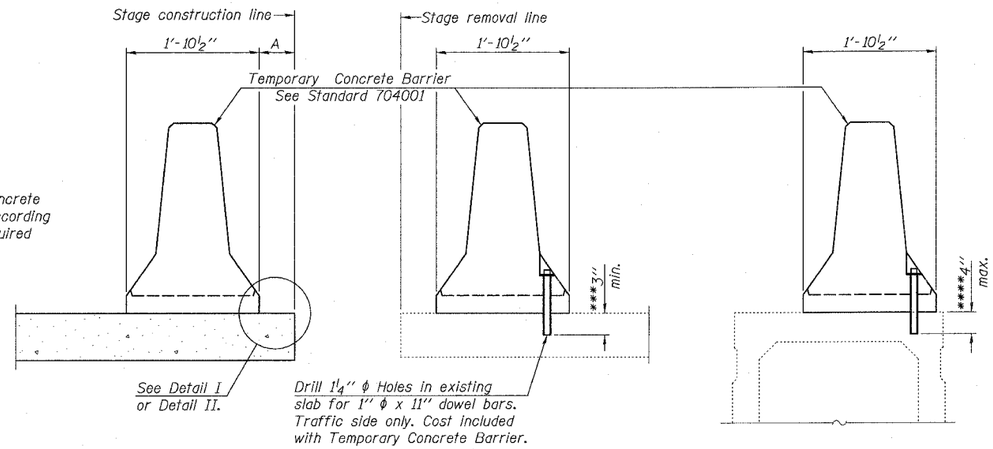
When "A" is 3'-6" or less, the temporary concrete barrier shall be anchored to the new slab according to Detail I or Detail II. No anchorage is required when "A" is greater than 3'-6".



NEW SLAB | EXISTING SLAB | EXISTING DECK BEAM

NOTES

Detail I - With Bar Splicer or Couplers:
Connect one (1) 1"x7"x10" steel ℙ to the top layer of couplers with 2-⅝" ϕ bolts screwed to coupler at approximate ℄ of each barrier panel.

Detail II - With Extended Reinforcement Bars:
Connect one (1) 1"x7"x10" steel ℙ to the concrete slab or concrete wearing surface with 2-⅝"ϕ Expansion Anchors or cast in place inserts spaced between the top layer of reinforcement at approximate ℄ of each barrier panel.

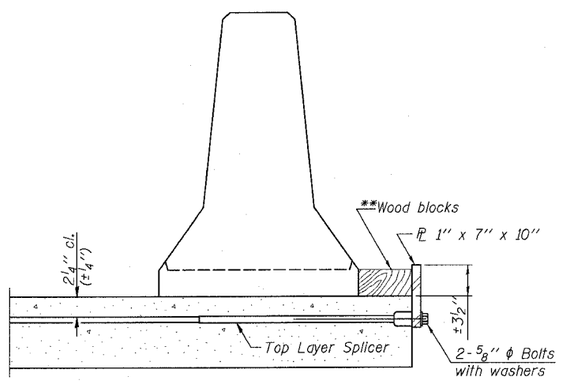
Cost of anchorage is included with Temporary Concrete Barrier.

The 1" x 7" x 10" plate shall not be removed until stage II construction forms and all reinforcement bars are in place and the concrete is ready to be placed.

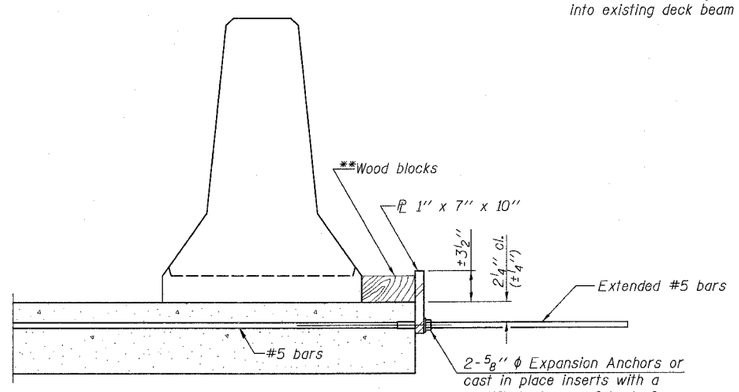
SECTIONS THRU SLAB OR DECK BEAM

***Dimension shown is minimum required embedment into concrete. If hot-mix asphalt wearing surface is present, minimum embedment shall be in addition to wearing surface depth.

****If existing deck beam is to remain in place after stage construction, embedment shall only be into wearing surface and not into existing deck beam concrete.



DETAIL I



DETAIL II

**Wood blocks may be omitted when required to provide minimum stage traffic lane width. When the wood blocks are omitted, the concrete barrier shall be in direct contact with the steel retainer plate.

GENERAL NOTES

1. The Engineer must be notified at least 72 hours prior to placing the temporary signals in operation so that arrangements can be made to inspect the installation and set the timing of the signals. The Contractor must furnish timing cycle gears of 60, 65, 70, 80 90, 100, and 110 seconds for the controller.
2. At any time that the signals are not operating the signal head shall be hooded and the SIGNAL AHEAD sign covered or removed.
3. The left signal head shall normally be mounted at a height of 10 feet above the road surface measured to the bottom of the signal head. The right head shall normally be mounted at height of 14 feet above the road surface. Baffle plates will be required on all signals.
4. All red lenses shall normally be 12 inch nominal diameter. The right signal head shall be aimed so the centers of the light beams of the indications are directed toward a point in the center of the approach lane 500 feet in advance of the signal. The left indication shall be aimed at a point in the center of the approach lane 100 feet in advance of the stop line.
5. Bidirectional steady burning lights and double vertical panels shall be mounted on the barrier or bridge rail at 20 foot centers. Detail A shows a suggested mounting for the temporary concrete barrier. Other methods of mounting may be used upon the approval of the Engineer.
6. All signs shall be post mounted if the closure time exceeds four days.
7. High intensity flashing lights shall be used on each approach in advance of the work area during hours of darkness and installed above the first two signs in each series.
8. Longitudinal dimensions may be adjusted slightly to fit field conditions.
9. All vehicles, equipment, men and their activities are restricted to all times to one side of the pavement unless otherwise authorized by the Engineer.
10. Temporary Bridge Rail shall be used across the bridge when specified in the plans.
11. Form BT 725 is required.

WHERE, AT ANY TIME, ANY VEHICLE, EQUIPMENT, MEN OR THEIR ACTIVITIES WILL ENCROACH ON ONE LANE OF A BRIDGE DECK AND TRAFFIC SIGNALS ARE REQUIRED.

EXISTING STRUCTURE: Structure No. 008-0016; Original Structure built in 1927 as S.B.I. Rt. 80; Section 104 B, consisted of one span concrete tee beams superstructure on closed concrete abutments, measuring 24'-8" out/out of deck and 43'-11" back/back of abutments. Improved in 1959 as S.B.I. Rt. 80, Section 104 BY-1. The 1959 Improvements consisted of partial removal of existing superstructure deck and widening with 27" deep precast prestressed concrete deck beams to 48'-8" out/out and the construction of new cantilevered wingwalls. Work under this section will consist of the complete removal and disposal of the existing superstructure and partial removal and disposal of portions of the existing abutment backwalls all in accordance with Section 501 of the Standard Specifications and as shown in the Detail Plans. Removal and reconstruction will be done in two stages. Stage I removal and reconstruction of the North portion of the structure to the limits shown on the Detail Plans and Stage II removal and reconstruction of the remaining portion of the structure.
