GENERAL NOTES

1. Noise Abatement Wall drilled shaft foundation diameter, depth and spacing to be determined by the Contractor.
2. Contractor shall verify location of existing utilities prior to construction. Contractor shall locate drilled shafts to provide at least 5 feet clearance to existing and proposed underground utilities. Damage to any utilities shall be repaired by the Contractor at no additional cost to the Department.
3. Wall stations and offsets are measured relative to ℄ Richards Ramp C (Sta. 100+00.00 to Sta. 114+20.00) or ℄ I-80 (Sta. 745+61.00 to Sta. 755+00.00) and are measured to the centerline of wall.
4. For top of wall, bottom of wall and ground elevations, see Sheets N2-1 to N2-2.
5. The maximum center-to-center post spacing shall be 20 feet.
6. The finish shall consist of a rolled Ashlar Stone finish and shall have a minimum 0.75 in impression.
7. Any rock excavation required for noise wall construction will not be paid for separately and will be included with Noise Abatement Wall, Ground Mounted. Based on the estimated top of rock elevations in the soil boring logs, rock excavation will only be required for construction of the drilled shafts.
8. Theoretical top of wall elevations, theoretical bottom of wall elevations, existing grade elevations at front face of wall and finished grade elevations at front face of wall shall be taken as straight lines in the segments between the stations shown in the Noise Wall Data Table.
9. Provide access doors every 1000' spaced evenly along length of wall. Access door location shown in the plans is approximate. Only locate doors where the grade at both faces of noise wall is even.

Benchmark: Cut square on NW wingwall of Richards St. bridge over Hickory Creek. Sta. 66+63.57, 43.68' Lt., Elev. 539.55

Existing Structure: S.N. 099-0123 was built in 1966 under Project I-80-4(37)134, Section 99-4B-2. The superstructure consists of steel beams on three simple spans supporting a composite reinforced concrete deck. The back-to-back of abutment length is 149'-10⅛" and deck width varies from approximately 87'-8" to 84'-0". Reinforced concrete stub abutments with wingwalls are founded on steel piles. Reinforced concrete wall-type piers have spread footings founded on rock. Repairs in 1993 included a deck overlay, deck joint replacement, and repairs to the parapets, railings, floor drains. Hickory Creek improvements in 2000 included footing protection at piers and abutments.

Traffic Control: Stage construction in order to maintain one lane of traffic in each direction during construction.

No Salvage.

GENERAL NOTES

1. Calculated weight of Structural Steel = 255,330 lbs (AASHTO M270 Gr. 50)
2. All new structural steel shall be metallized. See Special Provision for "Metallizing of Structural Steel".
3. Fasteners shall be ASTM F 3125 Grade A325 Type 1, hot dip galvanized bolts in metalized areas. Bolts $\frac{7}{8}$-in. ∅, holes $\frac{15}{16}$-in. ∅, unless otherwise noted.
4. No field welding is permitted except as specified in the contract documents.
5. Reinforcement bars designated (E) shall be epoxy coated.
6. Plan dimensions and details relative to existing plans are subject to nominal construction variations. The Contractor shall field verify existing dimensions and details affecting new construction and make necessary approved adjustments prior to construction or ordering of materials. Such variations shall not be cause for additional compensation for a change in scope of the work, however, the Contractor will be paid for the quantity actually furnished at the unit price bid for the work.
7. Bearing seat surfaces shall be constructed or adjusted to the designated elevations within a tolerance of $\frac{1}{8}$ inch (0.01 ft.). Adjustment shall be made either by grinding the surface or by shimming the bearings.
8. The existing structural steel coating contains lead. The Contractor shall take appropriate precautions to deal with the presence of lead on this project.
9. The embankment configuration shown shall be the minimum that must be placed and compacted prior to construction of the abutments.
10. Slipforming of the parapet is not allowed.

Notes:

Cost of retainer assembly is included with Temporary Concrete Barrier.

A retainer assembly shall be located at the approximate ℄ of each temporary concrete barrier.

The retainer plate shall not be removed until the concrete on the adjacent stage is ready to be poured. For Detail III applications the retainer plate shall not be removed until just prior to placing the adjacent beam.

When the 'A' dimension is less than 1½", the wood block shall be omitted and the barrier shall be placed in direct contact with the steel retainer plate. For deck beam applications the minimum required 'A' distance is 6" to accommodate the shear key clamping device.

Detail I - Installation for a new bridge deck or bridge slab.

Detail II - Installation for a new deck beam with an initial concrete wearing surface. Additional bar splicers shall be provided at 6'-0" centers and paired with the bar splicers of the concrete wearing surface reinforcement to accommodate the installation of the retainer assemblies. The cost of the additional bar splicers is included with the concrete wearing surface.

Detail III - Installation for a new deck beam with no initial wearing surface or with an initial hot-mix asphalt (HMA) wearing surface present. The deck beam directly beneath the temporary concrete barrier shall be fabricated with bar splicer inserts in the side of the beam, as detailed, to accommodate the installation of the retainer assemblies. A pair of bar splicers, 6" apart, shall be placed at 6'-0" centers along the length of the beam. The cost of the bar splicers is included with the deck beam.

DEAD LOAD DEFLECTION DIAGRAM

(Includes weight of concrete only.)

Note:
The above deflections are not to be used in the field if the engineer is working from the grade elevations adjusted for dead load deflections as shown on Sheets S-7 thru S-9.

DEAD LOAD DEFLECTION DIAGRAM

Girder No.	a	b	c	d	e	f	g	h	i

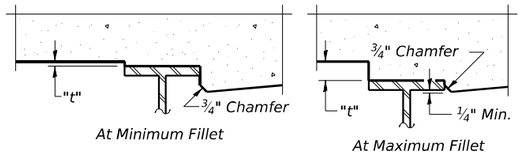
2-13	3/8"	3/8"	1/4"	0	0	0	1/4"	1/2"	3/8"



To determine "t": After all structural steel has been erected, elevations of the top flanges of the beams shall be taken at intervals shown below. These elevations subtracted from the "Theoretical Grade Elevations Adjusted for Dead Load Deflection" shown on Sheets S-7 thru S-9, minus slab thickness, equals the fillet heights "t" above top flange of beams.

LOCKING EDGE RAIL SPLICE

The inside of the locking edge rail groove shall be free of weld residue. Rolled rail shown, welded rail similar.

BILL OF MATERIAL

Item	Unit	Total
Preformed Joint Strip Seal	Foot	180

Notes:

The strip seal shall be made continuous and shall have a minimum thickness of ¼". The configuration of the strip seal shall match the configuration of the locking edge rails. Open or "webbed" strip seal gland configurations are not permitted. The gland shall be sized for a maximum rated movement of 4 inches.

The locking edge rails depicted are configured for typical applications and are conceptual only. The actual configuration of the locking edge rails and matching strip seal may vary from manufacturer to manufacturer provided they fit the application and meet the minimum anchorage shown. Flanged edge rails, however, will not be allowed. Locking edge rails may exceed the 4½" maximum depth provided the anchorage system is revised according to the manufacturer's recommendation.

The manufacturer's recommended installation methods shall be followed.

All steel components shall be galvanized after fabrication according to Article 520.03 of the Standard Specifications.

The Maximum space between locking edge rail segments shall be 3/16" and sealed with a suitable sealant; however, any rail joint within 10' measured perpendicular to the face of the curb or parapet shall be welded as shown in the locking edge rail splice detail.

The top surface of sidewalk sliding plates shall have a raised pattern according to ASTM A786.

Cost of parapet sliding plates, sidewalk sliding plates, embedded plates, anchorage studs, and expansion anchors included with Preformed Joint Strip Seal.

39" constant slope barrier shown, 44" constant slope barrier similar as noted.

The concrete opening below the strip seal will vary based on the locking edge rail chosen by the Contractor. Deck and parapet lengths shown elsewhere in the plans are dimensioned to the concrete opening, not the joint opening, and are based on the rolled locking edge rail. If the Contractor elects to use a different locking edge rail, dimensional adjustments may be required. One exception to this would be the strip seal joint at the end of the precast bridge approach slab. For these cases the pavement connector length shall be adjusted, not the length of the bridge approach slab.

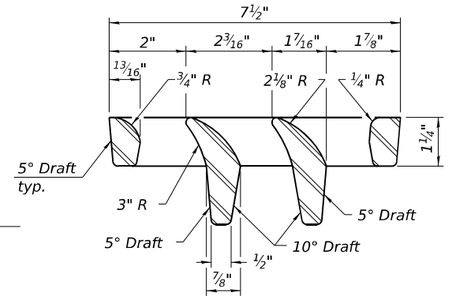
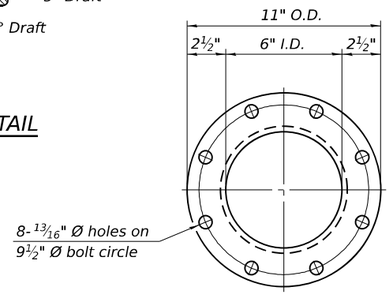
PLAN



VANE GRATE DETAIL



Notes:

All cast iron parts shall be gray iron conforming to the requirements of AASHTO M105, Class 35B and AASHTO M306.

Bolts, anchor rods, nuts and washers shall be according to ASTM A307 and shall be galvanized according to AASHTO M232. As an alternate stainless steel may be used.

Stainless steel hardware shall be according to Article 1006.29(d) of the Standard Specifications.

Structural steel weldments of equal sections and of the same configuration may be substituted for the cast iron scupper frames and downspouts; however, the scupper grates shall remain cast iron. Fillet or full penetration welds shall be used for the weldments. Details shall be submitted to the Engineer for approval.

Structural steel scupper frames and downspouts, when utilized, shall be galvanized according to AASHTO M111.

As an alternate, fiberglass may be used for downspouts according to ASTM D2996 with a short-time rupture strength hoop tensile stress of 30,000 psi min. in lieu of the cast iron or structural steel.

Exterior surfaces of downspouts and exterior exposed surfaces of the scupper frame below deck shall be pigmented or painted to match the color of the adjacent beam.

The Contractor shall take appropriate measures to assure that Protective Coat is not applied to the scupper.

Cost of the grate, frame, downspout, anchor rods, nuts and washers including complete installation of the scupper shall be paid for at the contract unit price for Drainage Scupper, DS-12.

DEAD LOAD DEFLECTION - STEEL SELF WEIGHT

(Includes weight of structural steel only.)

Notes:

1. The calculated deflections of the primary girders under steel self-weight shall be used to detail the diaphragm, cross frame and lateral bracing connections, and to erect the structural steel such that the girders will be plumb within a tolerance of ± 1/8" per vertical ft. throughout when supporting their own weight.
2. For span lenghts, see Sht. S-29.

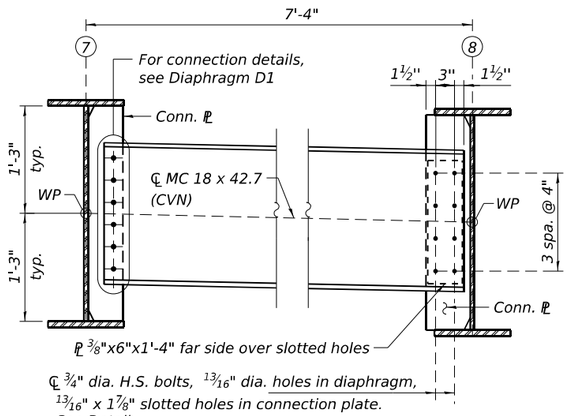
DIAPHRAGM D1 (PARTIAL)

(123 Required)

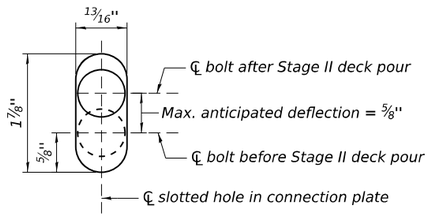
Erection Sequence for Diaphragm D2:

1. Install diaphragm before Stage II deck pour. Fully tighten bolts at Girder 7. Install bolts finger tight at Girder 8.
2. Complete Stage II deck pour.
3. Fully tighten all bolts.



DIAPHRAGM D2

(9 Required)



SLOTTED HOLE DETAIL FOR DIAPHRAGM D2

Note:
The slotted holes shall be positioned as shown to allow vertical deflection to occur during Stage II deck pour without laterally stressing the girders.

DESIGN NOTE:

1. SMALLER INTERSECTIONS: THE PAVEMENT JOINTS NEED TO BE ALIGNED. *
2. LARGER INTERSECTIONS (36' OR GREATER) OR INTERSECTIONS WITH A SKEW (70° OR LESS): THE PAVEMENT SEPARATION JOINT SHOULD BE CONSIDERED.

4. AN ALTERNATIVE, IS TO INCREASE THE PAVEMENT THICKNESS BY ½" FOR THE LENGTH OF THE AFFECTED PANELS AT THE INTERSECTION.
5. FOR LARGE INTERSECTIONS, (6 LANES OR MORE) WHERE JOINTS CAN BE MATCHED , USE #8 (25) DOWEL BARS INSTEAD OF #8 (25) TIE BARS AT EDGE OF MAINLINE PAVEMENT WHEN NO PAVEMENT SEPARATION JOINTS USED.
