#### STATE OF ILLINOIS DEPARTMENT OF TRANSPORTATION

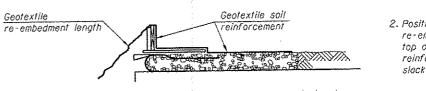

#### TEMPORARY GEOTEXTILE WALL TYPICAL SECTION

(Horizontal dimensions at right angle to € FAP 781)

13 to 12 Reinforcement spacing Form brace system I. Place form brace system on completed reinforcement level: back from the finished fabric face a distance of 13 to 12 the geotextile reinforcement spacing. Reinforcement spacing

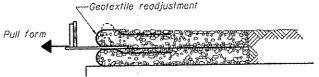

Zone where re-embedment length will be placed. Additional height of ·Compacted select fill compacted select fill, -Final lift height

2. Position fabric so that the required geotextile re-embedment length extends over the top of the form brace and the design reinforcement width is placed with no slack against the previous level.

3. Compact select fill material in lifts to final lift height, create (±3") depression in zone where re-embedment length will be located and place additional height of compacted select fill against form brace.

Re-embedment length -Cover with additional select fill placed in depression

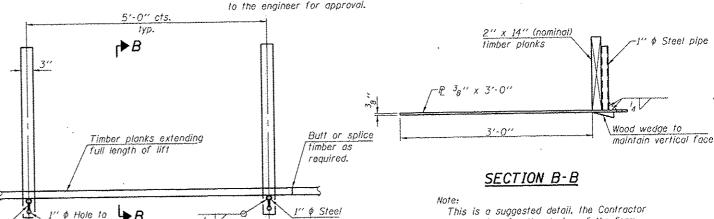

4. Fold geotextile re-embedment length back over form brace into zone where depression was made in select fill and place additional select fill (±3") to embed geotextile and bring to final lift height.

5. Pull form brace outward allowing geotextile face to slightly readjust to form light round face level with plan reinforcement spacing.

### TEMPORARY GEOTEXTILE WALL CONSTRUCTION SEQUENCE

The geotextile soil reinforcement shall have a minimum allowable tensile strength (T min.) of 25 lb./in. as determined by the procedure described in the Special Provision. The computations supporting the determination of (T min.) shall be submitted to the engineer for approval.
