

Illinois Department of Transportation

Abbreviated Structure Geotechnical Report

Original Report Date: 6/13/2023 Proposed SN: 053-0194 Route: FAP 673 (IL 116)
Revised Date: 3/9/2024 Existing SN: 053-0062 Section: (112BR)ES
Geotechnical Engineer: Jeremy Brown, P.E. (IDOT D3) County: Livingston
Structural Engineer: Contract: 66L79

Indicate the proposed structure type, substructure types, and foundation locations (attach plan and elevation drawing): The proposed structure will be a 3-span slab bridge on integral abutments with a back-to-back length of 88'-9", and have an out-to-out width of 36'. The structure will have a 20 degree left ahead skew. Load information provided by the Bureau of Bridges and Structures indicates factored loads of 802.6 kips at the abutments and 1016.4 kips at the two piers. Staged construction will be utilized for construction of the new bridge. An approved copy of the TS&L is attached.

Discuss the existing boring data, existing plans foundation information, new subsurface exploration and need for any additional exploration to be provided with SGR Technical Memo (attach all data and subsurface profile plot): Soil borings from 1965 are available and include a boring at each abutment and the existing center pier. Soil borings were conducted at the abutments in 2020 by IDOT. The 1965 soil borings were used to extend the 2022 borings since they were not drilled deep enough to accommodate driven pile foundations. Soil boring log 2 from 1965 was used to extend the depth of boring log 1 from 2022. Soil boring log 3 from 1965 is labeled "Center Pier", however the station/offset places it close to the proposed east abutment which is why it was used to extend the depth of soil boring 2 from 2022. The existing structure is a two-span concrete slab bridge with cantilever-type closed abutments with spread footings and has a solid battered stem pier supported on a spread footing. Copies of the boring logs are attached.

Provide the location and maximum height of any new soil fill or magnitude of footing bearing pressure. Estimate the amount and time of the expected settlement. Indicate if further testing, analysis, and/or ground improvement/treatment is necessary: Based on the approved TS&L, cuts and fills are proposed to be minimal for the approach pavement areas. Settlement of the approach pavement is little concern due to the minimal fills proposed. A site visit showed no signs of settlement. No further settlement analysis is warranted.

Identify any new cuts or fill slope angles and heights. Estimate the factor of safety against slope failure. Indicate if further testing, analysis or ground improvement/treatment is necessary: Minimal grade change is expected. The end slope on the creek side of the abutment will be a 1:2(V:H) slope with a slope height near 8 feet to the bottom of the proposed abutment. The short term FOS is estimated to be 2.363 and the long term FOS is 1.847. These factors of safety were estimated using the Slide 2 software using Boring 1 for the south abutment. No further analysis is warranted.

Indicate at each substructure, the 100-year and 200-year total scour depths in the Hydraulics report, the non-granular scour depth reduction, the proposed ground surface, and the recommended foundation design scour elevations: No scour was accounted for at the abutments per IDOT policy. The design scour elevations and bottom of abutment elevations are 651.23 and 651.07 for the west abutment and east abutment respectively. Per the Hydraulic Report, the total pier scour depths for Q100 and Q200 are 6.08 ft and 6.12 ft respectively. The following scour depths were calculated using the IDOT Scour Analysis spreadsheet. Copies of the spreadsheets are attached.

Event/Limit State	Design Scour Elevations (ft.)				Item 113
	W. Abut	Pier 1	Pier 2	E. Abut.	
Q100	651.23	638.40	638.40	651.07	8
Q200	651.23	638.30	638.30	651.07	
Design	651.23	638.40	638.40	651.07	
Check	651.23	638.30	638.30	651.07	

Determining the seismic soil site class, the seismic performance zone, the 0.2 and 1.0 second design spectral accelerations and indicate if that the soils are liquefiable: Seismic Soil Site Class = C. The SDS = 0.133g. The SD1 = 0.078g. The Seismic Performance Zone (SPZ) for this bridge = 1, therefore a liquefaction analysis was not performed.

Confirm feasibility of the proposed foundation or wall type and provide design parameters. Attach a pile design table indicating feasible pile types, various nominal required bearings, factored resistances available and corresponding estimated lengths at locations where piles will be used. Provide factored bearing resistance and unit sliding resistance at various elevations and confirm no ground improvement/treatment is necessary where spread footings are proposed. Estimated top of rock elevations as well as preliminary factored unit side and tip resistance values shall be indicated when drilled shafts are proposed: Soil borings 1 (SW Quad) and 2 (NE Quad) from 2022 and soil borings 2 (West Abut.) and 3 (Center Pier) from 1965 were used to design the foundations for the proposed structure. Integral abutments are feasible for the proposed structure. The abutments and piers should utilize conventional construction methods to drive piles until the desired nominal required bearing is achieved. Metal shell piles with a wall thickness of at least 0.312 inches and pile shoes are recommended for both abutments and piers due to the hard till layers encountered. Bedrock was not encountered in the soil boring logs, therefore H-piles are not recommended since they will drive significantly longer than metal shell piles. One test pile at each foundation element is recommended for a total of four test piles. The integral abutment feasibility analysis, pile design tables, and lateral loading soil parameters are attached.

Calculate the estimated water surface elevation and determine the need for cofferdams (type 1 or 2), and seal coat: From the hydraulic report, the estimated water surface elevation is 645.26. There will be two solid wall piers that will require in stream work. Because the EWSE of 645.26 is less than 6 ft. above the base of the concrete of the piers, type I cofferdams are recommended. From the data shown in the soil boring logs, it should not be an issue driving the sheet piling to the design depth at this location.

Assess the need for sheeting or soil retention or temporary construction slope and provide recommendation for other construction concerns: Temporary sheet piling will be necessary for staged construction. The soils within the embedment depth do not exceed 4.5 tsf, therefore temporary sheet piling is feasible and the pay item TEMPORARY SHEET PILING should be used.

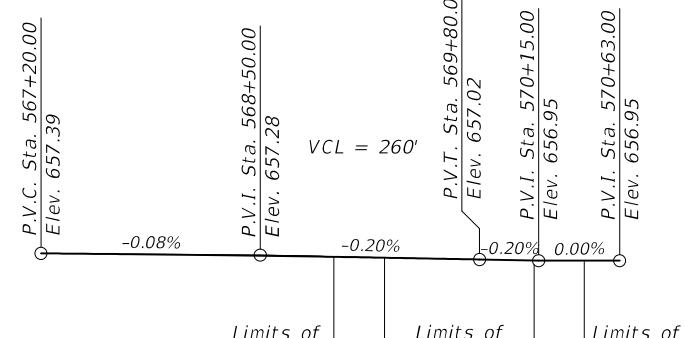

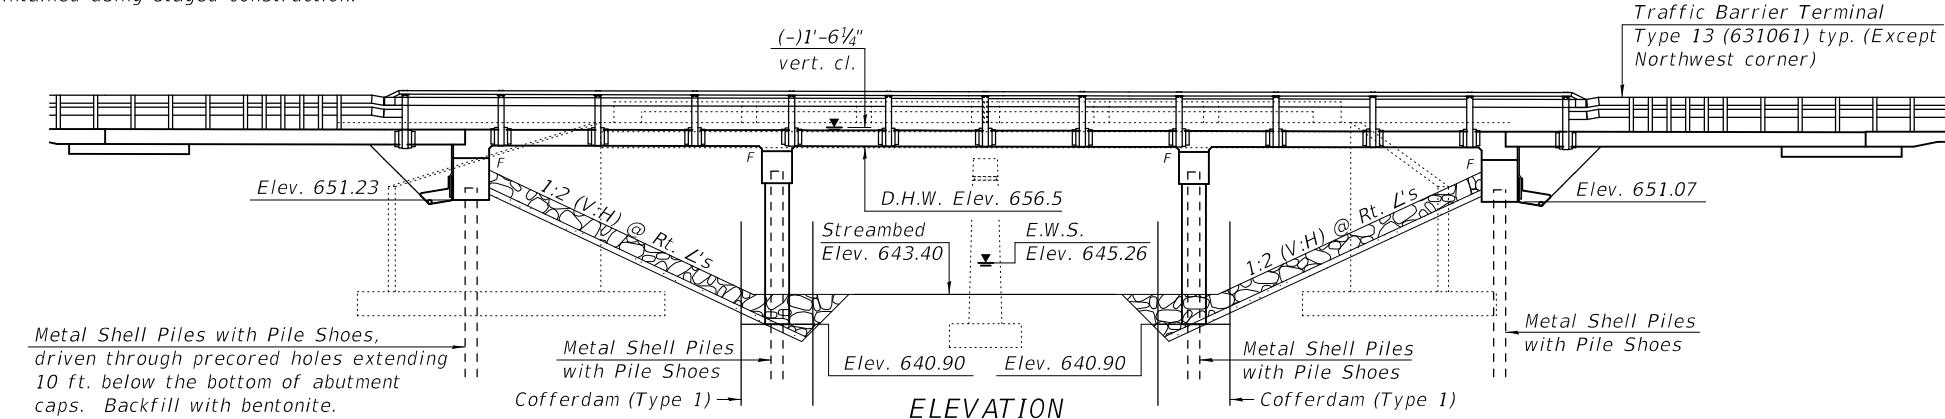

Benchmark: Cut "□" on top of S.W. Wingwall, Station 569+25.51, 24.86' Rt., Elev. = 657.302.

Existing Structure (No. 053-0062):

Was originally constructed in 1970 under F.A. Route 147, Section 112-BR at Sta. 569+68. The superstructure consists of a 2-span continuous 16" slab, all supported on solid battered stem pier and cantilever-type closed abutments supported on spread footings. The structure has a 24°15'00" left ahead skew, a 46'-6" out-to-out width and an overall length of 63'-5 $\frac{3}{8}$ " back-to-back. In 2002, the bridge was rehabilitated.

Traffic to be maintained using staged construction.

No Salvage.
